

## Are our workplaces safe? ... *Parts of the Body Injured* (Fourth of a Series)

*This issue of the LABSTAT Updates is the fourth in the series of statistical releases on occupational injuries that occurred in 2003. The inquiry is part of a nationwide survey called BLES Integrated Survey (BITS) conducted in coordination with the DOLE Regional Offices. The 2003/2004 BITS, undertaken last year, had a sample size of around 6,000 non-agricultural establishments employing 20 or more workers. It aimed to provide an integrated data set on employment patterns, industrial relations practices and occupational injuries.*

*The principal purpose of statistics on occupational injuries is for planning and setting priorities for preventive efforts. Changes in the patterns and occurrences of occupational injuries guide policymakers, program planners, employers and workers in identifying persistent and new areas of risk at the workplace and in evaluating safety performance and effectiveness of current accident preventive measures. The statistics are also useful in developing training materials and programs for accident prevention and providing basis for identifying areas for future research.*

*This series of LABSTAT Updates identifies the economic activities where occupational injuries occurred in 2003, their extent, severity and the way in which they occurred. This fourth issue focuses on the parts of the body injured. (See definitions of terms on page 2.)*

*In 2003, there were 23,265 cases of occupational injuries with lost workdays. More than 40 percent of these affected upper extremities of workers.*

### Four out of ten injuries were on upper extremities

upper extremities of the body.

More than 70 percent (7,374) of injuries to this body part were observed in manufacturing primarily in its three sub-industries of food products (1,883);

The 2003 inquiry on work-related injuries reported that 10,366 (44.6%) of the 23,265 total cases with workdays lost affected the

plastic products (561); and wearing apparel (538).

Hotels and restaurants (648 out of 1,195); transport, storage and communication (596 out of 1,558); construction (443 out of 1,114); and real estate, renting and business activities (214 out of 566) were the other major industry groups which also recorded upper extremities as most affected by injuries.

Lower extremities were the second most frequent part of the

body injured in the establishments surveyed at 28.8 percent (6,695). Around 61 percent (4,051) of these injuries was again noted in manufacturing and mostly in manufacture of food products (1,081).

Lower extremities of the body were the most frequently affected by injuries in electricity, gas and water supply (302 out of 805); private education services (50 out of 132); health and social work except public medical, dental and other health services (48 out of 96); financial intermediation (38 out of 100); and mining and quarrying (25 out of 60).

The third most common part of body injured was the head (3,875 or 16.7% of total cases with workdays lost). A substantial portion of head injuries were attributed to manufacturing (1,699 out of 14,254); wholesale and retail trade (1,108 out of 2,690) and other community, social and personal service activities (227 out of 546).

Manufacture of food products (393); manufacture of basic metals (156); manufacture of fabricated metal

products, except machinery and equipment (141); manufacture of radio, television and communication equipment and apparatus (128); and manufacture of plastic products (119) were the manufacturing sub-industries where most of the cases of head injuries were recorded.

Wholesale and retail trade which was second to manufacturing in terms of injuries with workdays lost reported that head injuries accounted for 41.2 percent of its total work-related injuries. Most of these injuries in this industry group were in retail trade, except of motor vehicles and motorcycles, repair of personal and household goods (862).

Lesser number of injuries affected the neck (170), trunk or internal organs (484), whole body or multiple sites equally injured (683) and back (992). These injuries combined comprised 10 percent of the total cases with workdays lost.

Most of the injuries to these body parts were observed in manufacturing particularly in manufacture of food products.

#### DEFINITION OF TERMS

**Head** - includes scalp, skull, brain and cranial nerves and vessels; ear(s); eye(s); tooth/teeth; other specified parts of the facial area; head, multiple sites affected

**Neck** - includes spine and vertebrae in the neck

**Back** - includes spine and vertebrae in the back

**Trunk or internal organs** - include rib cage (ribs including sternum and shoulder blades); other parts of thorax, including internal organs; pelvic and abdominal area, including internal organs; external genitalia; trunk, multiple sites affected

**Upper extremities** - include shoulder and shoulder joints; arm, including elbow; wrist; hand; thumb; other finger(s); upper extremities, multiple sites affected

**Lower extremities** - include hip and hip joint; leg, including knee; ankle; foot; toe(s); lower extremities, multiple sites affected

**Whole body and multiple sites equally injured** - systemic effect (for example, from poisoning or infection); this classification is to be used if several different parts of the body were equally injured/affected
